

End-to-End Error Modeling Signal, Retrieval and Validation

Validation by Correlative Measurements

Validation Issues

Why do We Need **Validation Model** Why We Can NOT Use Correlative Data As Is

- **Characteristic Difference**— validated sounder and correlative measurements sample atmosphere differently.
- **State Non-Coincidence** – correlative measurements are at different time and location.

Validation Model reconciles the issues by providing optimal linear estimate of the expected satellite measurements and assessing the errors

$$\mathbf{y}_{\text{val}} = \mathbf{B}\hat{\mathbf{y}}_{\text{cor}} = \mathbf{y}_{\text{sat}}(\mathbf{x}_{\text{sat}}) + \boldsymbol{\varepsilon}_{\text{val}}$$
